EGH 110...112: Duct transducer for relative humidity and temperature

How energy efficiency is improved

Accurate recording of air humidity for energy-efficient control of HVAC systems and monitoring energy consumption.

Areas of application

Measurement of relative humidity and temperature in air ducting.

- Measurement using fast, capacitive sensor
- Active measured value acquisition
- Insensitive to flow speeds and normal contamination
- EGH 111 and EGH 112 offer temperature measurement using an Ni1000 temperature detector

Technical description

- Housing lid made of yellow thermoplastic
- Accuracy ±10% rH (re-adjustable)
- EGH 110 automatically converts the output signal from 0(2)...10 V to 0(4)...20 mA with a load
- 30 mm ø sensor tube made of black, glass-fibre-reinforced thermoplastic
- Immersion depth: 50 to 156 mm

Туре	Humidity range % rh	Humidity output for 0100% rh	Temperature range °C	Temperature output	Weight kg	
EGH 110 F002	095	0(2)10 V ¹⁾	_	_	0.43	
EGH 111 F002	1095	010 V	-2070	Ni1000	0.43

Operation

Humidity measurement

The relative humidity is registered with a fast-acting, capacitive sensor and converted by a measuring amplifier into the linearised standard signal.

Temperature measurement

EGH 111: with Ni1000 temperature sensor; curve as per DIN 43760.

EGH 112: the temperature 0...50 °C is converted into the standard signal 0...10 V-

Engineering and fitting notes

In installations which may be susceptible to dew formation, the transducer should not be fitted with the sensor tube facing upwards. The curve's good linearity and constance make it unnecessary to calibrate the measuring span. For test measurements, the zero point can be varied by \pm 10 %rh. The measurement system requires practically no maintenance and is unaffected by either flow speed or contamination. Calibration at the factory.

Notes for the user

Generally speaking, humidity sensors are subject to accelerated ageing if they are employed in very contaminated air or aggressive gases. Under such conditions, the sensor may drift prematurely. It is possible to compensate for this drift by $\pm 10\%$ using the H10% rh adjuster if accurate measurements are required.

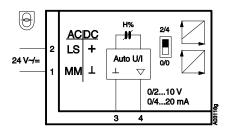

If the sensors are used in very contaminated air, a premature re-calibration or, if necessary, the replacement of the complete sensor is not covered by the general warranty provisions.
