

## Screw jacks SJ Series

### Screw jacks SJ Series with travelling screw (Mod.A) STRUCTURAL ELEMENTS

- 1 - acme screw in steel C 43 (UNI 7847), rolled or whirled thread  
 2 - worm shaft with true involute, ground worm profile ZI (UNI 4760), made in steel, case-hardened  
 3 - bronze wormwheel with internal nut, toothed with true involute profile ZI (UNI 4760)  
 4 - thrust ball bearing for high load capacity  
 5 - monoblock gear box  
 6 - threaded cover with guide for acme screw; may be used as a spigot diameter  
 7 - grub screw which prevents the threaded cover unscrewing  
 8 - guide for acme screw; may be used as a spigot diameter  
 9 - long-life synthetic grease lubricated worm gearbox  
 10 - grease nipple  
 11 - radial lubricant seal  
 12 - O-Ring as lubricant seal

## Screw jacks SJ Series

- 1 - acme screw in steel C 43 (UNI 7847), whirled thread
- 2 - bronze travelling nut with flange
- 3 - worm shaft with true involute, ground worm profile ZI (UNI 4760), made in steel, case-hardened
- 4 - bronze wormwheel with true involute profile ZI (UNI 4760)
- 5 - cast iron support of the wormwheel bronze rim
- 6 - acme screw fixed to the wormwheel through LEFT-HAND (for push load) or RIGHT-HAND (for pull load) metric thread
- 7 - lock nut with the opposite direction metric thread to ensure safe acme screw fixing
- 8 - acme screw – wormwheel pins against unscrewing
- 9 - slotted spring pin
- 10 - thrust ball bearing for high load capacity
- 11 - monoblock gear box
- 12 - threaded cover with guide for acme screw; may be used as a spigot diameter
- 13 - grub screw which prevents the threaded cover unscrewing
- 14 - guide for acme screw; may be used as a spigot diameter
- 15 - long-life synthetic grease lubricated worm gearbox
- 16 - grease nipple
- 17 - radial lubricant seal
- 18 - O-Ring as lubricant seal

## Screw jacks SJ Series - 1-start acme screw

Following tables show the screw jack LINEAR SPEED  $v$  [mm/s] and relative TORQUE  $T_1$  [Nm] and POWER  $P_1$  [kW] on input shaft, with reference to the INPUT SPEED  $n_1$  [rpm], the RATIO (RV, RN, RL) and the LOAD [kN] applied on the screw jack.

Intermediate values for linear speed  $v$ , torque  $T_1$  and power  $P_1$  at different input speed can be calculated by linear interpolation of the figures stated in the table.

The figures in the tables refer to work with max. duty cycle of 30 % over 10 min time period or 20 % over 1 hour time period at 25°C environment temperature.

**ATTENTION!** The figures in the red shaded area indicate operational restrictions due to thermal limits. When the selection is made within such area, the duty cycle must be reduced or the greater size screw jack must be selected, in order to allow effective heat dissipation. For a better evaluation, please contact SERVOMECH Engineering Dpt.

## Screw jacks SJ Series - 1-start acme screw

Following tables show the screw jack LINEAR SPEED v [mm/s] and relative TORQUE T<sub>1</sub> [Nm] and POWER P<sub>1</sub> [kW] on input shaft, with reference to the INPUT SPEED n<sub>1</sub> [rpm], the RATIO (RV, RN, RL) and the LOAD [kN] applied on the screw jack.

Intermediate values for linear speed v, torque T<sub>1</sub> and power P<sub>1</sub> at different input speed can be calculated by linear interpolation of the figures stated in the table.

The figures in the tables refer to work with max. duty cycle of 30 % over 10 min time period or 20 % over 1 hour time period at 25°C environment temperature.

**ATTENTION!** The figures in the **red shaded area** indicate operational restrictions due to thermal limits. When the selection is made within such area, the duty cycle must be reduced or the greater size screw jack must be selected, in order to allow effective heat dissipation. For a better evaluation, please contact SERVOMECH Engineering Dpt.

## Screw jacks SJ Series - 1-start acme screw

Following tables show the screw jack LINEAR SPEED  $v$  [mm/s] and relative TORQUE  $T_1$  [Nm] and POWER  $P_1$  [kW] on input shaft, with reference to the INPUT SPEED  $n_1$  [rpm], the RATIO (RV, RN, RL) and the LOAD [kN] applied on the screw jack.

Intermediate values for linear speed  $v$ , torque  $T_1$  and power  $P_1$  at different input speed can be calculated by linear interpolation of the figures stated in the table.

The figures in the tables refer to work with max. duty cycle of 30 % over 10 min time period or 20 % over 1 hour time period at 25°C environment temperature.

**ATTENTION!** The figures in the red shaded area indicate operational restrictions due to thermal limits. When the selection is made within such area, the duty cycle must be reduced or the greater size screw jack must be selected, in order to allow effective heat dissipation. For a better evaluation, please contact SERVOMECH Engineering Dpt.

## Screw jacks SJ Series - 2-starts acme screw

Following tables show the screw jack LINEAR SPEED  $v$  [mm/s] and relative TORQUE  $T_1$  [Nm] and POWER  $P_1$  [kW] on input shaft, with reference to the INPUT SPEED  $n_1$  [rpm], the RATIO (RV, RN, RL) and the LOAD [kN] applied on the screw jack.

Intermediate values for linear speed  $v$ , torque  $T_1$  and power  $P_1$  at different input speed can be calculated by linear interpolation of the figures stated in the table.

The figures in the tables refer to work with max. duty cycle of 30 % over 10 min time period or 20 % over 1 hour time period at 25°C environment temperature.

**ATTENTION!** The figures in the red shaded area indicate operational restrictions due to thermal limits. When the selection is made within such area, the duty cycle must be reduced or the greater size screw jack must be selected, in order to allow effective heat dissipation. For a better evaluation, please contact SERVOMECH Engineering Dpt.

## Screw jacks SJ Series - 2-starts acme screw

Following tables show the screw jack LINEAR SPEED  $v$  [mm/s] and relative TORQUE  $T_1$  [Nm] and POWER  $P_1$  [kW] on input shaft, with reference to the INPUT SPEED  $n_1$  [rpm], the RATIO (RV, RN, RL) and the LOAD [kN] applied on the screw jack.

Intermediate values for linear speed  $v$ , torque  $T_1$  and power  $P_1$  at different input speed can be calculated by linear interpolation of the figures stated in the table.

The figures in the tables refer to work with max. duty cycle of 30 % over 10 min time period or 20 % over 1 hour time period at 25°C environment temperature.

**ATTENTION!** The figures in the **red shaded area** indicate operational restrictions due to thermal limits. When the selection is made within such area, the duty cycle must be reduced or the greater size screw jack must be selected, in order to allow effective heat dissipation. For a better evaluation, please contact SERVOMECH Engineering Dpt.

## Screw jacks SJ Series - 2-starts acme screw

Following tables show the screw jack LINEAR SPEED  $v$  [mm/s] and relative TORQUE  $T_1$  [Nm] and POWER  $P_1$  [kW] on input shaft, with reference to the INPUT SPEED  $n_1$  [rpm], the RATIO (RV, RN, RL) and the LOAD [kN] applied on the screw jack.

Intermediate values for linear speed  $v$ , torque  $T_1$  and power  $P_1$  at different input speed can be calculated by linear interpolation of the figures stated in the table.

The figures in the tables refer to work with max. duty cycle of 30 % over 10 min time period or 20 % over 1 hour time period at 25°C environment temperature.

**ATTENTION!** The figures in the red shaded area indicate operational restrictions due to thermal limits. When the selection is made within such area, the duty cycle must be reduced or the greater size screw jack must be selected, in order to allow effective heat dissipation. For a better evaluation, please contact SERVOMECH Engineering Dpt.

## Screw jacks SJ Series - 2-starts acme screw

Following tables show the screw jack LINEAR SPEED v [mm/s] and relative TORQUE T<sub>1</sub> [Nm] and POWER P<sub>1</sub> [kW] on input shaft, with reference to the INPUT SPEED n<sub>1</sub> [rpm], the RATIO (RV, RN, RL) and the LOAD [kN] applied on the screw jack.

Intermediate values for linear speed v, torque T<sub>1</sub> and power P<sub>1</sub> at different input speed can be calculated by linear interpolation of the figures stated in the table.

The figures in the tables refer to work with max. duty cycle of 30 % over 10 min time period or 20 % over 1 hour time period at 25°C environment temperature.

**ATTENTION!** The figures in the **red shaded area** indicate operational restrictions due to thermal limits. When the selection is made within such area, the duty cycle must be reduced or the greater size screw jack must be selected, in order to allow effective heat dissipation. For a better evaluation, please contact SERVOMECH Engineering Dpt.

## Screw jacks SJ Series - options

### Screw jack housing fixing holes

On the gear housing of screw jack SJ Series there are fixing holes, which can be tapped holes (on both housing fixing planes) or through holes.

Note that position of threaded holes on the fixing plane differs from the positions of the through holes.

Ordering code: **FF** for threaded holes (STANDARD)

Ordering code: **FP** for through holes (ON REQUEST)

### Stop nut

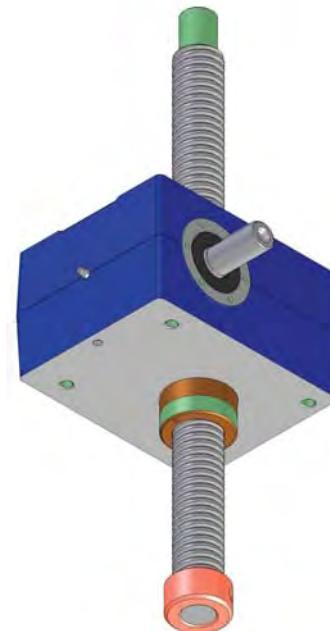

Available for screw jacks with travelling screw (Mod. A) only.

The mechanical stop prevents the acme screw thread unscrewing clear of the screw jack housing. It is a washer pinned at the acme screw end (opposite the attachment side) that blocks the screw translation when reaching the relative stop.

The acme screw length is defined to allow, under normal use, at the maximum extended position, 20 mm of additional stroke (safety extra-stroke).

If the mechanical stop reaches accidentally the relative stop, it is necessary to check the screw jacks components to verify possible damages.

Ordering code: **SN**

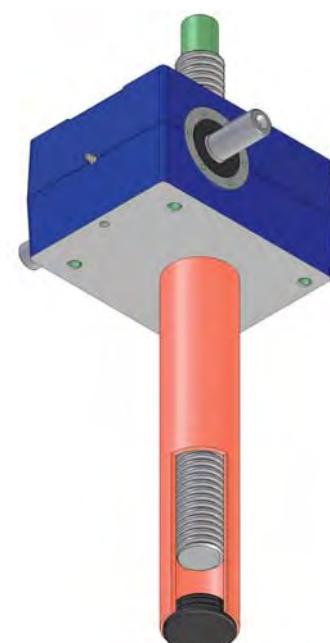

### Protective tube

Available for screw jacks with travelling screw (Mod. A) only.

The protective tube is screwed in the raised cover CA and encloses the acme screw below the housing, protecting it from damages and/or environment pollution such as dust, water, etc. Furthermore, it allows the fitting of other options such as limit switches and/or anti-turn device.

Material is aluminium or steel if anti-turn device is fitted.

Ordering code: **T**

## Screw jacks SJ Series - options

### Anti-turn device

Available for screw jacks with travelling screw (Mod. A) only.

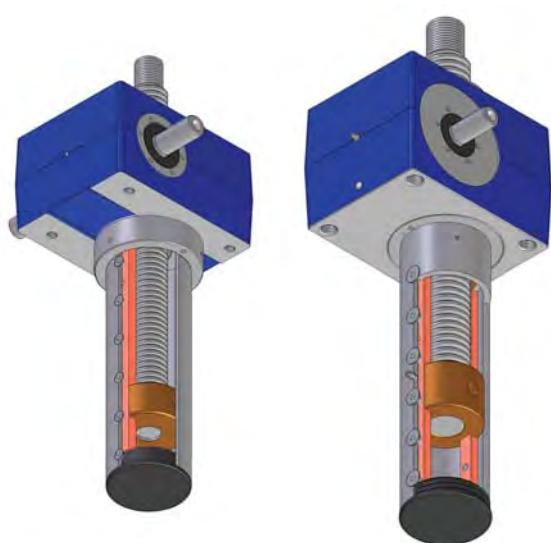

The anti-turn device is necessary when the load to be lifted may turn, i.e. the screw guidance does not prevent rotation, or in case the application does not properly allow the acme screw reaction to permit the translation.

Functioning: a steel key is fitted along the protective tube and a keyed bronze washer is fixed at the end of the acme screw; this prevents the screw rotation and forces the screw translation.

Up to screw jack size 50 (acme screw Tr 40x7) included, the anti-turn device has only one key; from size 100 (acme screw Tr 55x9) on, it has two keys.

The bronze bush also acts as a stop nut against acme screw unthreading.

Ordering code: **AR**

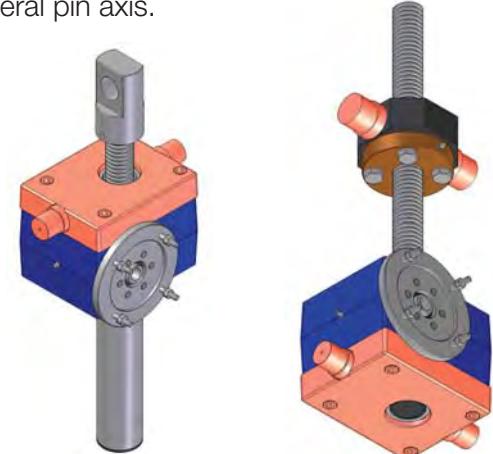

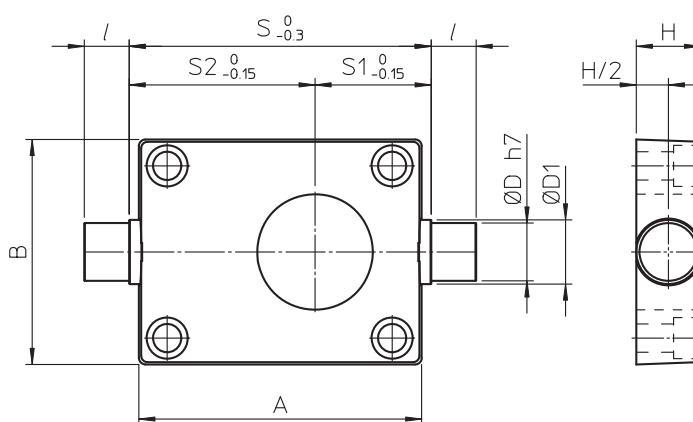

### Trunnion mount

Available for both screw jacks models: with travelling screw (Mod. A) and with travelling nut (Mod. B).

The trunnion mount bolts on to either the top or the bottom of the screw jack housing and allows pivoting of the screw jack around the axis defined by trunnion mount's lateral pins.

On screw jack Mod. A: the acme screw attachment must have a cylindrical hole with axis parallel to the trunnion mount lateral pin axis.

On screw jack Mod. B: the part of the machine where the bronze nut MB is fixed must have two lateral cylindrical pins (or holes) with axis parallel to the trunnion mount lateral pin axis.

Ordering code: **SC (opp. screw side)** screw jacks Mod. B with SC fitted on side opposite to screw

## Screw jacks SJ Series - options

### Bellows

Available for both screw jacks models: with travelling screw (Mod. A) and with travelling nut (Mod. B).

In applications with particular environment conditions, bellows protect the screw from contaminants.

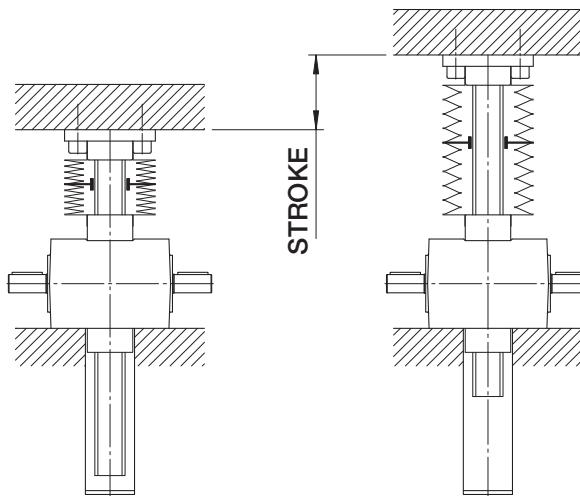

Unless otherwise required in the purchase order, bellows supplied are circular, sewn, in NYLON with a PVC outside and inside coating, suitable for industrial applications in general. For special application requirements, bellows in material suitable for use in specific environment (marine environment, food industry, environment with presence of abrasive material, ...) or in different execution (split with zip or velcro, moulded in PVC or rubber bellows, ...) could be supplied on request.

The bellows cause changes to the retracted and extended lengths and screw jack overall dimensions stated in the catalogue. On request, orders will be acknowledged with a screw jack drawing giving exact dimensions.

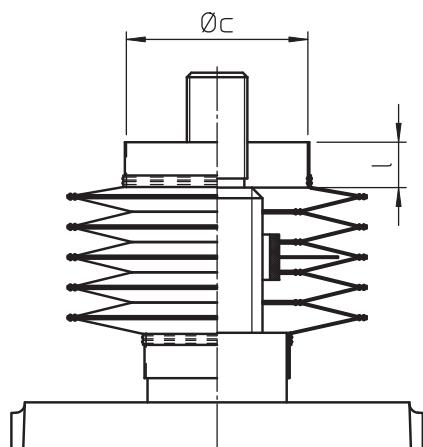

### Screw jacks SJ Mod.A with bellows

Usually, bellows are fitted between the acme screw attachment and worm gearbox, and at the opposite side the protection tube is fitted.

If necessary, a protective bellows can be fitted on the opposite side of the worm gearbox too.

In case the screw jack shall have a screw without attachment (with threaded end NF only), we advise to specify required collar dimensions ( $\varnothing c$ ,  $l$ ) in the purchase order.

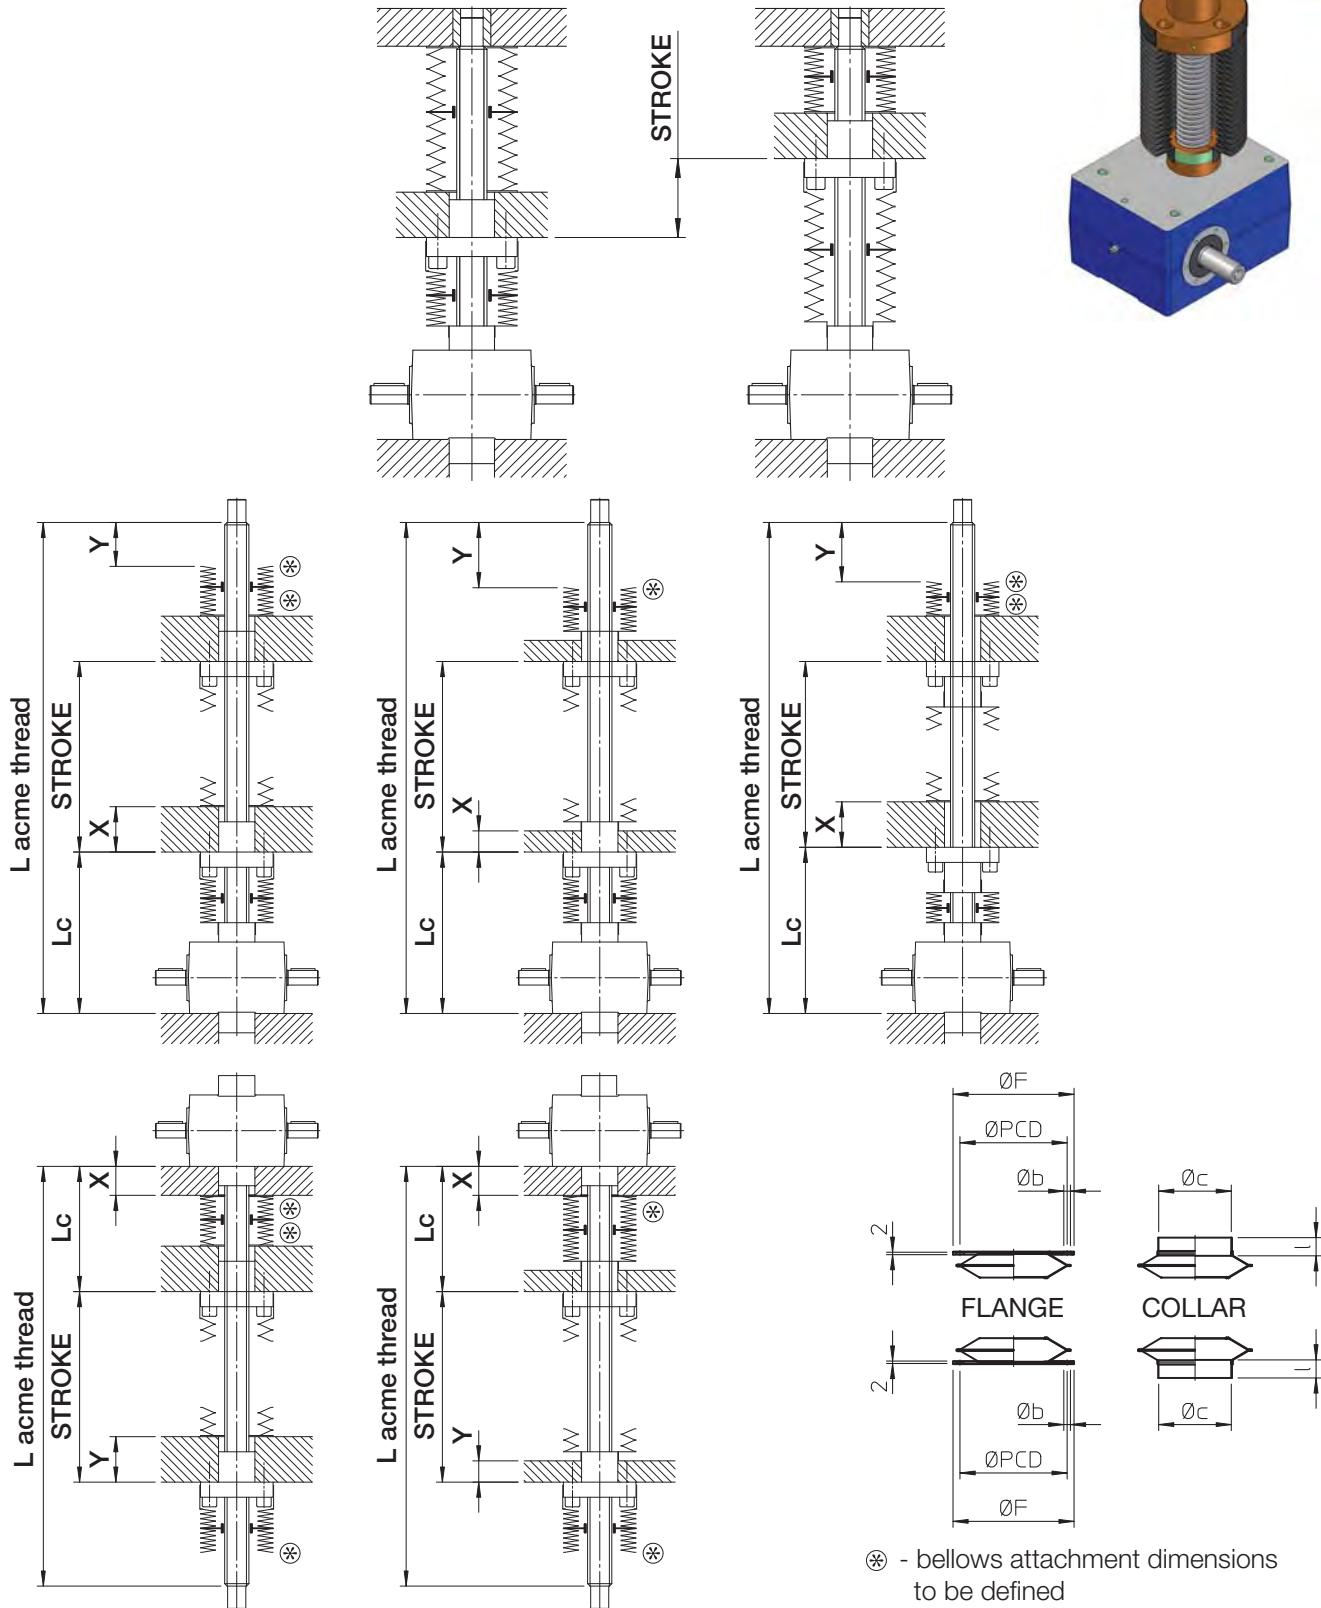

Ordering code: **B**

## Screw jacks SJ Series - options

### Screw jacks SJ Mod.B with bellows

Bellows are normally fitted between the screw jack housing and the nut and also between the nut and the acme screw end. Some applications may require bellows in only one of these two position.

The dimension of the bellows attachment between screw jack housing and bronze nut is determined by the screw jack's dimensions while the bellows attachment between bronze nut and acme screw end depends on the application structure the bellows shall fit.

## Screw jacks SJ Series - options

### Safety nut

Available for both screw jacks models: with travelling screw (Mod. A) and with travelling nut (Mod. B).

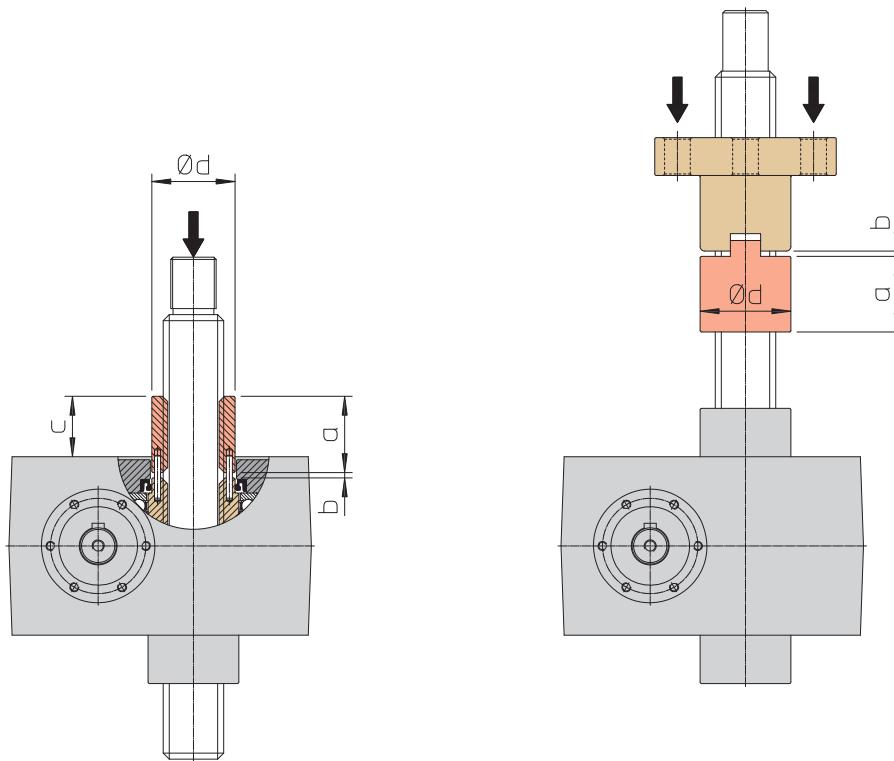

The safety nut is a back-up feature to prevent the load dropping in an uncontrolled manner in the event of working nut thread breaking due to overload or achieving of critical wear level (wear level that causes the breaking of the remaining thread section with normal working load only).

The safety nut is an extension to the standard nut (wormwheel inside Mod.A screw jacks or external travelling nut of Mod.B screw jacks) and changes the screw jack overall dimensions.

The safety nut works with one particular load direction only. Its position as regards the standard nut is conditioned by the load direction.

Following drawings show a screw jack with safety nut in case of acme screw subjected to push load. In case of pull load, the position of the nut would be on the opposite side of the screw jack housing (Mod. A) or of the external travelling nut (Mod. B).

By new screw jacks, the distance **b** between standard nut and safety nut is equal to the half of the profile pitch (**P**) of the acme thread.

Screw jacks SJ Mod.A with safety nut

Ordering code: **SBC pull** screw jacks Mod.B with safety nut for pull load

## Screw jacks SJ Series - options

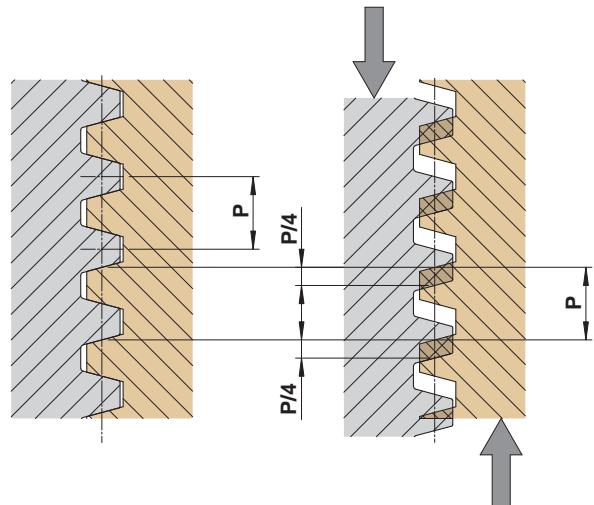

### Acme thread wear level check

Available for both screw jacks models: with travelling screw (Mod. A) and with travelling nut (Mod. B).

Due to working conditions (load, speed, temperature, lubrication), the thread of the working nut wears out. Some applications require the possibility to keep the current wear level under control to prevent reaching the critical wear level and consequent thread breaking by replacing the nut early.

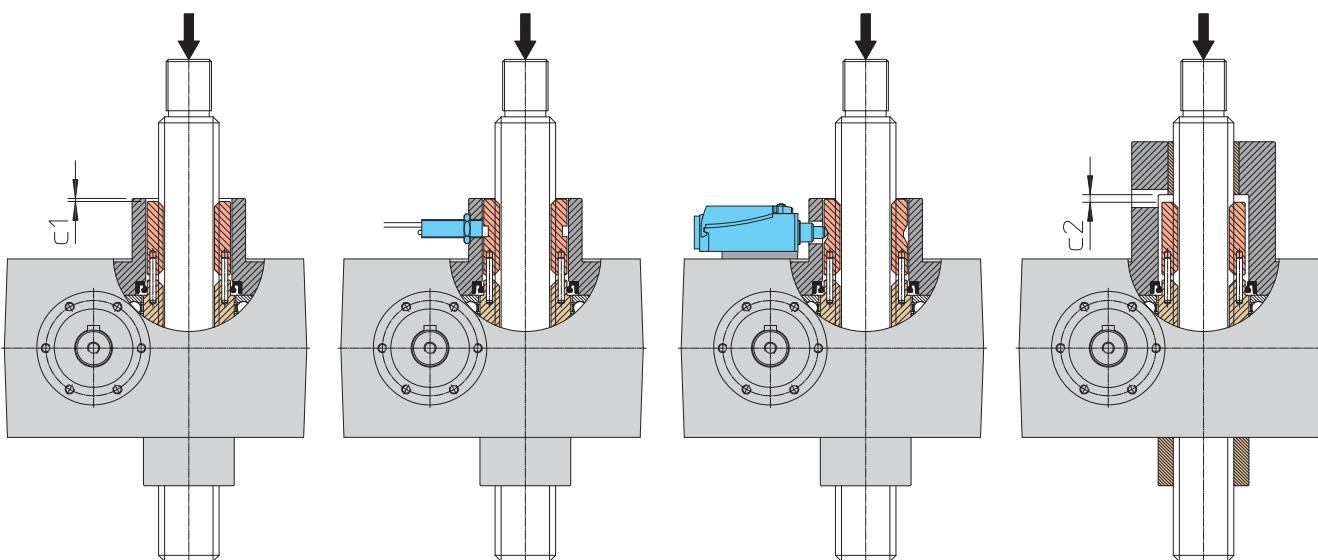

Usually, a value equal to 1/4 of the profile pitch ( $P$ ) of the acme thread is considered as max. wear level admitted.

With thread wear, the distance  $b$  between working nut and safety nut (see drawings on previous page) reduces to the working nut. By measuring this change, it is possible to get the current wear level of the thread.

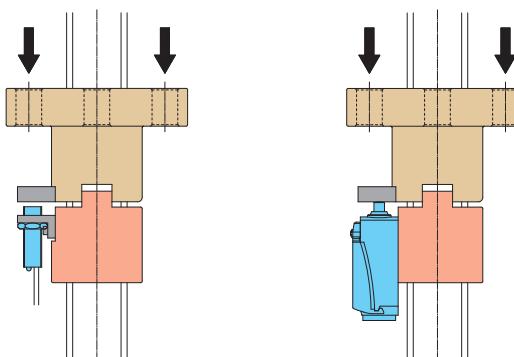

Following drawings show the possible solutions:

- check of dimension  $c_1$ ,  $c_2$ ,  $c_3$  or  $c_4$  for screw jacks with travelling screw (Mod. A) or of distance  $b$  for screw jacks with travelling nut (Mod. B) - see drawings on previous page and below - comparing the current value with the initial one (with new screw jack),
- appliance of an electric switch (see drawings below) which is activated when the pre-established wear level is reached giving an electric signal.

Thread wear control on screw jacks SJ Series Mod.A

Thread wear control on screw jacks SJ Series Mod.B

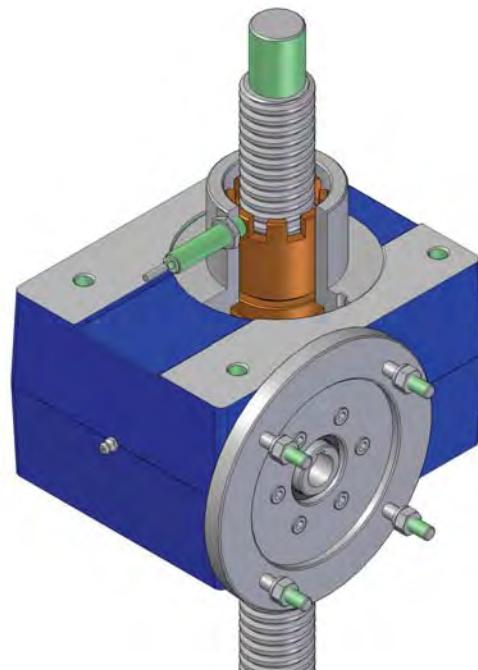

## Screw jacks SJ Series - options

### Wormwheel rotation detector

Available for screw jacks with travelling screw (Mod. A) only.

Some applications require the possibility to verify if the wormwheel rotates while the worm shaft is moving in order to get information about the good condition and functioning of the wormwheel toothing.

Usually, this device is required for applications where a safety nut is already present. A “crown” of empty and full spaces (created by machining the safety nut end, see picture on the right), while rotating, activates a corresponding proximity switch. As output of such proximity switch, activated and deactivated by the alternation of empty and full spaces, a “train” of impulses is generated and it confirms the rotation of the wormwheel. On the contrary, the constant output signal of the proximity means the stop of the wormwheel.

### Magnetic stroke end switches

Available for screw jacks with travelling screw (Mod. A) and for size 5, 10 o 25. Not compatible with anti-turn device AR.

**Functioning:** the magnetic stroke end switches are sensors with reed contact and are fixed with a clamp on the protective tube T, made in aluminium or other non-magnetic metal. They are activated by the magnetic field generated by a magnetic ring fitted on the acme screw end.

In case the screw jack is not stopped after the sensor activation, without magnetic field the sensor restores the original state. In case the limit switches are used to stop the screw jack, we recommend to provide for an electric connection in order to latch the signal and to prevent that the screw jack moves again in the same direction.

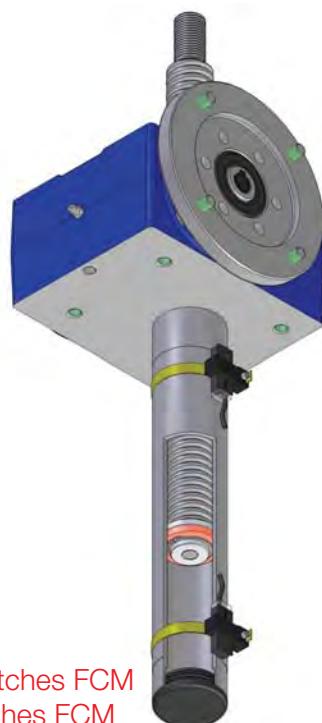

Screw jacks with magnetic limit switches are supplied with two sensors for the acme screw extreme positions. On request, extra switches for intermediate distances can be supplied.

The position of the sensors along the tube is adjustable.

SENSOR FEATURES		
Switching output	reed	
Contact	normally CLOSED	normally OPEN
Supply voltage	(5 ... 120) V ac/dc	(5 ... 230) V ac/dc
Voltage drop	$\leq 3.5$ V	
Corrente continuativa	$\leq 100$ mA ac	
Switching capacity	$\leq 6$ W	
Connection	cable, 2 x 0.12 mm <sup>2</sup> , length 2 m	

Ordering code: **FCM-NC** for screw jacks with normally closed magnetic switches FCM

Ordering code: **FCM-NO** for screw jacks with normally open magnetic switches FCM

## Screw jacks SJ Series - options

### Inductive proximity stroke end switches

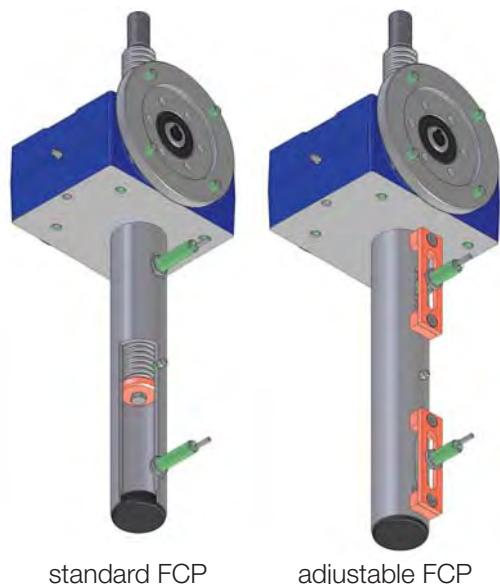

Available for screw jacks with travelling screw (Mod.A) only.

Functioning: proximity limit switches are PNP inductive sensors with normally CLOSED contact (NC) fitted on the protective tube and activated by the metallic ring fixed on the acme screw end.

In case the screw jack is not stopped after the sensor activation, when the metallic ring moves away the sensor restores the original state (becomes deactivated). In case the limit switches are used to stop the screw jack, we recommend to provide for an electric connection in order to latch the signal and to prevent that the screw jack moves again in the same direction.

Screw jacks with proximity limit switches are supplied with two sensors for the acme screw extreme positions. Extra switches for intermediate distances available on request.

On standard execution, the sensors position along the tube is not adjustable and is not angularly fixed. On request, it can be supplied with angular position at customer's indication.

standard FCP

adjustable FCP

Execution with axial adjustment of the sensors position available on request.

Technical details:

Type	inductive, PNP
Contact:	normally CLOSED (NC)
Nominal voltage:	(10 ... 30) Vdc
Max. output current:	200 mA
Voltage drop (activated sensor):	< 1.8 V
Wires	3 x 0.2 mm <sup>2</sup>
Cable length	2 m

Ordering code: **standard FCP (not adjustable)**  
**adjustable FCP**

### Material: stainless steel

For applications in particular environment conditions or in food industry, the screw jacks SJ Series can be supplied with stainless steel acme screw and/or screw attachment on request. Available steels: AISI 303, AISI 304, AISI 316.

Ordering code: **TR inox** stainless steel acme screw for screw jacks Mod. A or Mod. B

Ordering code: **P inox** stainless steel flange end P, for screw jacks Mod. A

Ordering code: **TF inox** stainless steel rod end TF, for screw jacks Mod. A
